

Admission Module - Frontend Patch Report

Generated: 22 May 2026, 05:32 PM

Project: Plasmit Hospital HMS

Scope: Admission module only, frontend/localStorage functional preview.

1. Summary

This report lists the Admission-related files created/updated and the functional frontend workflow implemented. The module is built as a role-wise admission workflow inspired by the Admission_Module_All_Screens.pdf reference.

No backend API, database, real authentication, or server-side admission persistence is included.

Current persistence is browser localStorage only.

2. Admission Routes Created

- src/app/(app)/admission/page.tsx | /admission | Admin workflow overview
- src/app/(app)/admission/reception/page.tsx | /admission/reception | Reception patient lookup
- src/app/(app)/admission/doctor/page.tsx | /admission/doctor | Doctor admission order
- src/app/(app)/admission/admission-desk/page.tsx | /admission/admission-desk | Admission desk request queue
- src/app/(app)/admission/billing/page.tsx | /admission/billing | Billing and insurance clearance
- src/app/(app)/admission/bed-manager/page.tsx | /admission/bed-manager | Bed manager and allotment
- src/app/(app)/admission/nurse-receive/page.tsx | /admission/nurse-receive | Nurse receive patient
- src/app/(app)/admission/nurse-care/page.tsx | /admission/nurse-care | Nurse patient care

3. Admission Feature Files Created/Updated

- src/features/admission/types.ts: Shared Admission TypeScript types: screens, priorities, requests, beds, billing, nurse records, activities, and store state.
- src/features/admission/data/admission-data.ts: Static screen config, patients, requests, billing clearances, 100 generated beds, checklist, and workflow card metadata.
- src/features/admission/admission-store.ts: Client-side state store using localStorage. Provides actions for patient scenario, doctor order, request status, billing review, bed allotment, nurse receive, care start, and reset demo.
- src/features/admission/pages/admission-pages.tsx: Page-level composition for every Admission route, wrapping each screen in the shared Admission layout.
- src/features/admission/components/admission-screen-layout.tsx: Shared Admission page header, role tabs, workspace description, chips, and step navigation.
- src/features/admission/components/admission-status-badge.tsx: Reusable status badge tone mapping for request, priority, billing, bed, and workflow states.
- src/features/admission/components/admission-fields.tsx: Reusable field wrappers, input, select, and textarea helpers retained for Admission forms.
- src/features/admission/components/patient-lookup-workspace.tsx: Reception workspace: patient search/select, old patient re-admission, new patient, emergency unknown patient, continue to doctor order.
- src/features/admission/components/doctor-admission-order.tsx: Doctor workspace: patient prefill, source, doctor, type, ward, priority, instructions, submit admission request.
- src/features/admission/components/admission-requests-workspace.tsx: Admission Desk workspace: search/filter queue, verify request, billing hold, send to bed allotment.
- src/features/admission/components/billing-clearance-workspace.tsx: Billing workspace: live pending/high-risk/estimate metrics, clear billing, apply billing hold.
- src/features/admission/components/bed-manager-workspace.tsx: Bed Manager workspace: 100-bed search/filter/status/ward view, active request selector, selected bed panel, allot available bed.
- src/features/admission/components/nurse-receive-workspace.tsx: Nurse Receive workspace: select ready patient, received by/time, identity/order/bed checklist, confirm patient received.
- src/features/admission/components/nurse-care-workspace.tsx: Nurse Care workspace: select

received patient, record BP/pulse/temperature/notes, start patient care.

- src/features/admission/components/admin-workflow-overview.tsx: Admin overview: live metrics, workflow cards, activity log, reset demo, embedded reception lookup.

4. Existing File Updated for Admission Menu

- src/data/navigation.ts: Admission sidebar menu updated with PDF-based children: Admin Overview, Reception, Doctor Order, Admission Desk, Billing Clearance, Bed Manager, Nurse Receive, Nurse Care.

Note: Non-admission role-login/sidebar filtering changes were reverted as requested. Current navigation change is only the Admission menu entry.

5. Functional Frontend Flow

- Reception selects patient or creates a new/emergency scenario. This writes selectedPatientId and selectedScenario into Admission localStorage state.
- Doctor submits an admission order. This creates a new request and matching billing clearance, then marks it as active.
- Admission Desk can verify requests, place billing hold, or open the active request in Bed Manager.
- Billing can clear a pending clearance or apply hold. Request status updates accordingly.
- Bed Manager can search/filter 100 beds, select an active request, and reserve an available bed. Request moves to Ready for Nursing.
- Nurse Receive completes received-by, received-time, and checklist. Request moves to Received.
- Nurse Care records initial vitals and notes. Request moves to Care Started.
- Admin Overview reads the same store and shows live metrics, workflow status, and activity history.

6. Store Actions Added

- resetDemo() - resets Admission frontend demo state.
- selectPatient(patientId) - selects patient for Reception/Doctor flow.
- startScenario(scenario) - starts old/new/emergency admission scenario.
- submitDoctorOrder(input) - creates admission request and billing clearance.
- updateRequestStatus(requestId, status) - changes desk/request status.
- reviewBilling(input) - clears or holds billing clearance and updates linked request.
- setActiveRequest(requestId) - sets current workflow request.
- allotBed(bedId, requestId) - reserves available bed and marks request Ready for Nursing.
- confirmReceive(record) - records nurse handover and marks request Received.
- startCare(record) - records vitals/care notes and marks request Care Started.

7. Important Technical Notes

- All interactive workflow state is frontend-only and stored under localStorage key: plasmit-admission-frontend-state-v1.
- The store initializes with deterministic server-safe defaults, then loads browser localStorage after hydration.
- No changes were made to backend APIs because this project currently has no backend admission service wired here.
- The module uses existing project UI primitives: Button, Card, Badge, Input, DataTable, AlertBanner, and shell PageHeader.
- Admission routes were smoke-tested on port 3004 and returned HTTP 200.
- npm run typecheck passed after the Admission updates.

8. Patch-Style High Level Diff

- + Added src/features/admission/admission-store.ts for shared localStorage workflow state.
- + Extended src/features/admission/types.ts with billing status, scenario, nurse records, activities, and store state.
- + Rebuilt Admission route wrappers under src/app/(app)/admission/**.
- + Added/updated role-wise Admission components for Reception, Doctor, Desk, Billing, Bed

Manager, Nurse Receive, Nurse Care, and Admin Overview.

- + Added 100-bed generated inventory in `src/features/admission/data/admission-data.ts`.
- + Updated `src/data/navigation.ts` only to expose the Admission submenu hierarchy.
- Removed old Admission implementation from earlier workflow before rebuilding PDF-based structure.
- Removed later non-admission role-login/sidebar guard experiment after instruction to keep changes inside Admission module.

9. Verification

- `npm run typecheck`: PASS
- GET `/admission`: 200
- GET `/admission/reception`: 200
- GET `/admission/doctor`: 200
- GET `/admission/admission-desk`: 200
- GET `/admission/billing`: 200
- GET `/admission/bed-manager`: 200
- GET `/admission/nurse-receive`: 200
- GET `/admission/nurse-care`: 200

10. Suggested Handoff

Give this PDF with the code patch when explaining what was created. For real production integration, backend APIs, database tables, authentication permissions, server validation, and audit logs should be added later.
